## What is Maven:

- It's a project management tool. Helps developers with:
  - Build generation
  - Dependency resolution
  - Documentation etc.

- Maven uses POM (Project Object Model) to achieve this.

- When "maven" command is given, it looks for "pom.xml" in the current directory & get needed configuration.

---

learningspringboot *(your app name)*
```
└── pom.xml
    └── src
        └── main
            └── java
                └── com
                    └── conceptandcoding (company name)
                        └── learningspringboot (app name)
                            └── Application.java
        └── test
            └── java
                └── com
                    └── conceptandcoding (company name)
                        └── learningspringboot (app name)
                            └── ApplicationTest.java
```

            </plugin>
        </plugins>
    </build>
</project>
```

It specifies the XML schema, also make sure that our XML adheres to correct structure and version defined by maven.

Used to define the Parent project. Current project inherit the configurations from the specified Parent project. Which in turn might get inherited from the Super Pom.

If this <parent> field is not specified, maven by-default inherit the configurations from "Super Pom".
This is the link of maven Super POM:
https://maven.apache.org/ref/3.6.3/maven-model-builder/super-pom.html

Unique identifier of your project

Define Key-Value pair for configuration. Can be referenced through out the pom file.

This is from where Maven look for project dependencies and download the artifacts (jars)

This is where we declare the dependencies that our project relies on.

Lets first understand the BUILD LIFECYCLE

Maven Build lifecycle phases:

- If you want to run "package" phase, all its previous phase will get executed first.

- And if you want to run specific goal of a particular phase, then all the goals of previous phases + current phase goals before the one you defined will get run.

Maven already has Validate phase defined and its goal, but if we want to add more goals or task, then we can use <build> element. And add the goal to specific phase.

Validate :   `mvn validate`

```xml
<plugin>
    <groupId>org.apache.maven.plugins</groupId>
    <artifactId>maven-checkstyle-plugin</artifactId>
    <version>3.1.2</version>
    <executions>
        <execution>
            <id>validate-checkstyle</id>
            <phase>validate</phase>
            <goals>
                <goal>check</goal>
            </goals>
        </execution>
    </executions>
    <configuration>
        <configLocation>myCodeStyle.xml</configLocation>
    </configuration>
</plugin>
```
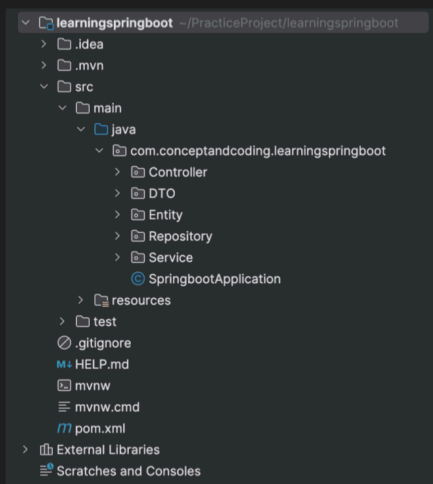

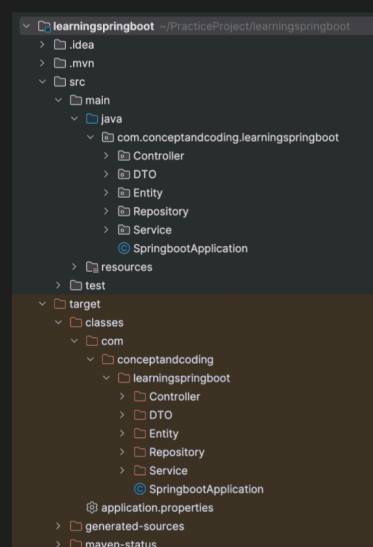

Compile: **Run the command:**   `mvn compile`

It will validate and compile your code and put it under ${project.basedir}/target/classes

```

    > maven-status

Previously, "Ant" was popular, there we have to tell what to do and also how to do.
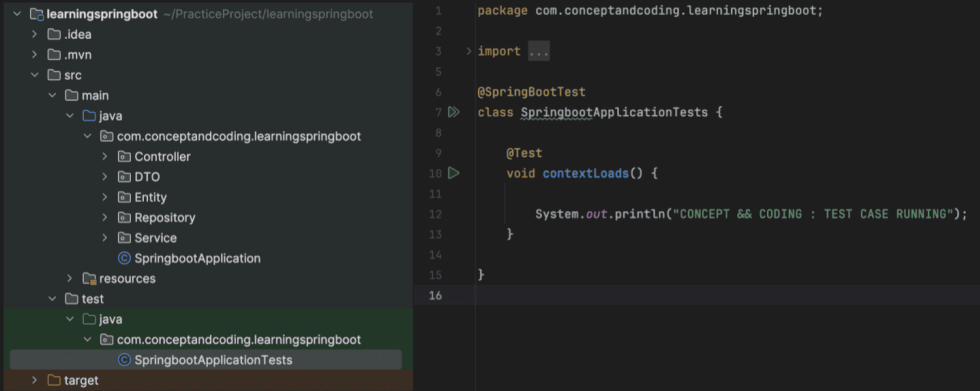

```
<project default="compile">
<target name="compile">
//some other properties here
<javac destdir="{provide your destination directory}">
<src>
<pathelement location="src/main/java"/>
</src>
//some other properties here
</javac>
</target>
</project>
```
Test: `mvn test`

Validate
Project Structure

Compile
Source Code

Test the
code (Unit test)

Package Compiled Code
(ex: Jar or War)

Verify the Integrity
Of Package

Deploy the package
In Remote Repository

Install the package
In Local Repository

It will validate, compile and then run the TEST cases in your project.

```

After "mvn package"

Verify: `mvn verify`

Validate
Project Structure

Compile
Source Code

Test the
code (Unit test)

Package Compiled Code
(ex: Jar or War)

Verify the Integrity
Of Package

Deploy the package
In Remote Repository

Install the package
In Local Repository

It can perform some additional checks apart from unit test cases like:
- **STATIC CODE ANALYSIS**
- **CHECKSUM VERFICATION etc...**

STATIC CODE ANALYSIS:

```xml
<plugin>
        <groupId>org.apache.maven.plugins</groupId>
        <artifactId>maven-pmd-plugin</artifactId>
        <version>3.21.2</version>
        <executions>
                <execution>
                        <id>pmd-analysis</id>
                        <phase>verify</phase>
                        <goals>
                                <goal>pmd</goal>
                        </goals>
                </execution>
        </executions>
</plugin>
```
PMD is a source code analyzer:
- ○ **Finds unused variable**
- ○ **Finds unused imports**
- ○ **Empty Catch block**
- ○ **No usage of object**
- ○ **Finds duplicate code etc...**

Install: `mvn install`

It will install the .jar package in local Maven Repository.
which is typically located in your user home directory (~/.m2/repository)
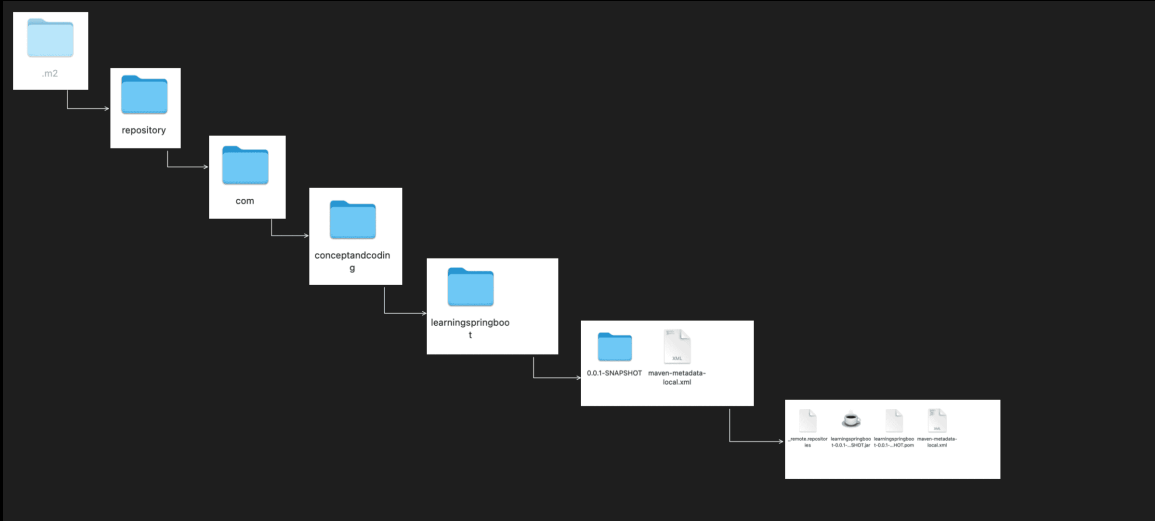

settings.xml (in .m2 folder)

```
<settings xmlns="http://maven.apache.org/SETTINGS/1.0.0"
          xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"

Deploy: mvn deploy

| Validate | Compile | Test the | Package Compiled Code | Verify the Integrity |
| Project Structure | Source Code | code (Unit test) | (ex: Jar or War) | Of Package |

Deploy the package
In Remote Repository

Install the package
In Local Repository

It will deploy the .jar to REMOTE Repository

pom.xml

```
<project>
    <!-- ... other project configurations ... -->

    <distributionManagement>
        <repository>
            <id>remote repository id</id>
            <url>https://remote-repository-url</url>
        </repository>
    </distributionManagement>

    <!-- ... other pom.xml configurations ... -->
</project>
```

settings.xml

```
<settings>
    <!--  other settings configurations  -->

    <servers>
        <server>
            <id>remote repository id</id>
            <username>remote-repository-username</username>
            <password>remote-repository-password</password>
        </server>
    </servers>

    <!--  other settings configurations -->
</settings>
```

If we do not define the remote repository, then MAVEN during "mvn deploy" command we will face below error

```
[INFO] --- deploy:3.1.1:deploy (default-deploy) @ learningspringboot ---
